

# Utopia: an alternative to the current structure of society, economy and politics

Jonathan THALER

November 14, 2016

## Abstract

## 1 Introduction

## 2 The current system

current system supports debt which introduces structural inequalities and power of some (minorities) over others (majorities), inflation? it always has to grow, which is completely unrealistic as no system can continuously grow as it will converge to an infinite consumption of energy: time and space are in the end limited. exploiting of impowered majorities by minorities through: debt, labor and its conditions,

it reinforces and supports structural inequalities by exploiting people and manipulating people to not cooperate and work against each other

also the economic research tries (still) to keep up the status quo and is holding on to total unrealistic assumptions which helps manifesting the current economic system by giving it "firm scientific foundations" - science serves here an ideological purpose: justification of an unjust, repressive system.

power is a major problem as it corrupts people. all. no exception.

the political system and political class is so far away from the people they should serve. they only serve their own purpose and try to keep up their power - that's just natural for any system to keep itself alive

## 3 A Solution

dissolve states

cooperative small-scale economies without monetary system organized in small communities. no minority ruling class, no minority controlling surplus, no debt, no individual richness, no individual property

but: communities consist of people. there will be struggle for more power, more influence over others,... how can this be addressed? keep it small enough,

no rulers, everyone equal rights, no individual property. different people will contribute different to the community: this WILL result in jealousy as one thinks he has contributed more than another. this needs to be considered VERY careful

what can we do against manipulation? people are easily manipulateable, especially by fear (the small death). when groups and communities are manipulated the dynamics can become terrible with extreme irrationalities

thus we must constitute a faith in the greater good of all =, creating an ideology =, will lead to MASSIVE destruction and death

is there a way out?

the question is if the non-monetary, cooperative, democratic communities economy works on a global scale or if the whole system would break down if it has reached some critical point. it would be interesting to pursue this question in a simulation but for this a model needs to be developed and research-questions need to be formulated.

## 4 The Human Factor

In the end humans will be the problem with their fear they are susceptible to manipulation and thus the whole thing can be brought down again. What can take fear away? Belief, strong leaders, security,...
